```
"""
Simple Daily Expense Tracker
Beginner-friendly Python script (Solution 2 from
my Week 1 strategic plan).

Concepts used:
- Variables : named boxes that hold data (budget,
total)
- Lists     : a collection of items (expenses)
- Loops     : repeat steps (keep asking until the
user types 'q')
- Conditions: if / else decisions (budget warning,
input checks)
- Files     : save data in a CSV file so it is not
lost
"""

import csv
import os
from datetime import date
